Lester Snow -

I am writing in regards to CALFED's programs involving water usage. CALFED plans on raising dams to increase the capacity of water storage, this is attacking the problem of water shortage from the wrong end. What needs to be changed is consumption, not storage. Beneficial changes include water reclamation, increasing water efficiency, and highly drought resistant crops. I well often see sprinkler systems running mid-day, both agricultural & private. This is a flatent mis-use of water and should be fined. I suggest using water meters.

Please consider the environmental interests of the California population. Realize that dams are not the answer to water shortage, efficient use is. Let us enjoy the rivers as they are, without further dams & alterations.

Thank you for your time & consideration.
