

With regards to Clean Water Action Alert:

The current practice of building dams, aqueducts, and diverting water from one place to another, is a 'big gun' approach. The solution becomes the problem in a short time. We need a paradigm shift that will put a long term telescope on water treatments. Everything we do should be considered for what effect it will have on the environment one hundred years from now. This is the only way to ensure sensible, save, long term policies. The 'conservation solution' is the only current solution that addresses the issue in this manner.
