RE: Comments on draft programmatic EIS/EIR

We, residents and agricultural producers in Calaveras County, have a number of concerns with CalFed's proposals.

The first is, there is no firm commitment in the plan that as an area of origin we will be able to retain our water rights. These rights must be upheld regardless of how much water we are using at the present time. The rural mountain counties need assistance from CalFed to build additional impoundment facilities and a binding assurance that all the water we have a right to as a county of origin will be held in reserve and be available for our use in meeting the demands of our rapidly growing population. Protection of the area of origin and our water rights must be upheld by any CalFed proposal. The CalFed proposals are lacking this commitment.

There is a great deal of uncertainty and concern about Ecosystem Restoration and Watershed Management requirements and the effect they will have on land use and activities in the upper watersheds. The Ecosystem Restoration Program Plan could become the most intrusive restoration program in the world. One of the stated CalFed objectives is to "improve riparian habitat". We have concerns as to where and how much "improvement" is actually needed and what the proposed solutions are. Our livestock producers are concerned about potential impacts to grazing. CalFed must defer to existing non-point source pollution control programs already in place. The State Water Resources Control Board has adopted the non-point source three-tier approach for protection of water quality, and has entered into MAA's with BLM and Forest Service to address non-point source issues in the upper watersheds. CalFed must recognize and encourage these efforts and not overlay another whole program over an existing one.

To make the system work, CalFed needs to assure us that there will be a reliable long-term water supply that treats the needs of all users fairly. To accomplish this, CalFed needs to make a firm commitment to expanded storage facilities and they haven't done that. Conservation alone won't provide enough water to meet the needs of the environment, agricultural needs, and the needs of our increasing population. The most important form of conservation is to be able to save excess water in wet years by collecting it in reservoirs to be used in drought years.

The CalFed proposals rely too heavily on farmland conversion and retirement to accomplish their goals. Depending on the proposal, anywhere from 250,000 to 1,000,000 acres could be lost from agricultural production. No one benefits or "gets better" from this solution, everyone loses--the individual farmer; local communities; the California economy (agriculture in this state is a \$25 billion industry); and all of us as consumers who now benefit from the wholesome, abundant food supply.

To be successful, the CalFed Plan must first make a firm commitment to expanded water storage. Without substantial additional storage the rest of the plan will fail. We need CalFed to succeed but we cannot accept the solutions that have been proposed.

Sincerely,

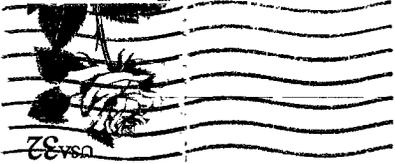

for Jack Kuhl, President
Calaveras County Farm Bureau
