

Evaluation of DEFT-NONAME through Delta Alternative for striped bass by the striped bass team. Team members: D. Stevens, D. Kohlhorst and L. Miller.
September 11, 1998.

Reported by: Lee W. Miller

We had only a few hours to consider the operations studies and complete the exercise. Relative to existing conditions which are a baseline of zero, the DEFT-NONAME conditions resulted in higher QWEST for April-June and lower entrainment in the spring/summer but higher entrainment losses later in the August-September period. We scored the overall improvements, an EXCEL worksheet was filled in and the score was an improvement of about 2/3 over the existing conditions. Hence I scored it as a 2 relative to existing conditions of zero. The certainty level is 2.

- higher QWEST flow for April- June.
- Reduced exports and entrainment losses April-June.
- Higher exports and higher entrainment in August and September.
